

Announcing New Hardware Versions of GVPH1A and LVMU1A

Beginning immediately, Toshiba will be shipping new hardware versions of the GVPH1A and LVMU1A - Version 4 voice mail circuit cards. These new circuit cards can be identified by the Version 4 or V.4 next to the part number on the card, but retain all the programming, features, and functionality of the previous models of the GVPH1A and LVMU1A. Though these new cards install, program, and function identically to the earlier version cards, there are two significant hardware differences.

LVMU1A

The most noticeable difference is with the LVMU1A. Similar to the MIPU card, the new LVMU1A Version 4 circuit card is a half-sized unit that is mounted on a plate so that it can be installed into the card slots of Strata CIX100, 200, 670, and 1200 cabinets.

Remote Access Modem

The other difference in hardware between the GVPH1A / LVMU1A - Version 4 cards and earlier version circuit cards is that the remote access modem is now embedded in the board. This means that the Version 4 boards do not require an AMDS1A remote access modem daughter board attached to them.

Compatibility

There is no change to the compatibility of these boards.

- The GVPH1A is specifically for the Strata CIX40.
- The LVMU1A is compatible with the Strata CIX100, CIX200, CIX670 and CIX1200 systems.

The part numbers will also remain the same, so there are no changes for either the online price book or CIX Quote with this release.

Pricing

There are no price changes or ordering differences with these new circuit cards.

Documentation

The latest Strata CIX Installation and Maintenance manual has been updated to include images of these new circuit cards. However, all of the instructions for the installation and programming of these new cards remain the same.
